

VCS16251: Safety Audits

Workplace safety is too important to try and figure out "on the fly," or leave to chance. When employees' lives and health are on the line, a company can't just wait for trouble to occur before making improvements.

That's why safety-conscious organizations have been taking a more proactive approach by conducting "safety audits"... systematic surveys of workplaces to identify hazards so they can be eliminated or controlled.

REALTIME-SAFETY's training products on "Safety Audits" provide employees with an understanding of the goals and procedures that are involved in a safety audit, show them how they can help in the audit process and describe specific safe work practices. And these updated versions of the products include all-new visuals and a fresh look and feel... to engage trainees more effectively and promote better learning.

Topics covered in these products include:

- Performing a "workplace analysis".
- "Systems of controls".
- Evaluating your work area.
- Performing a "personal" safety audit.
- Dealing with accidents.

This Micro-Learning curriculum includes the following modules:

- "Performing a Workplace Analysis"
- "Your Facility's System of Controls"
- "Evaluating Your Own Work Area"
- "Performing a Personal Safety Audit"
- "Dealing with Accidents"
